

Corner REINFORCEMENT STYLES

Northern Radiator provides two different corner reinforcement styles on many radiators. Some have triangular brackets in all four corners. The other, newer style, has reinforcement clips between the tubes and headers in all four corners and incrementally across the header depending on the size of the core. Both styles offer strong, beneficial reinforcement, but over a period of time Northern Radiator will be transitioning to the tube/header clip style reinforcement only. Throughout the transition period, you may see either style in the product you purchase.
